

AABP POSITION STATEMENT

AABP Cattle Vaccine Position Statement

Vaccines are an important tool for the prevention and control of disease in cattle, which is not only important for cattle health, well-being and productivity, but also as an important component of antimicrobial stewardship. AABP supports the use of evidence-based scientific methods to discover, develop and approve vaccines and vaccine technologies for cattle. As with all veterinary medications or products, any novel technologies that are used in cattle vaccines are required to undergo a substantial evaluation and approval process by the relevant federal agency. Evaluations must satisfy requirements for product purity and target animal safety in addition to fulfilling requirements for human food safety.
